E11 / 1 OF 3 - INSTALL AND ALLOCATE

# User manual

## Install and launch

Extract the complete package into a writable folder. In section B6 / Windows_x64, double-click Run_SYNCLAB_Group_01.cmd. It launches the bundled Windows 64-bit app using data/student_data.db. Qt installation is unnecessary for this route. For source builds, open B5 / SYNCLAB / StudentWorkshopApp.pro in a Qt 6 Desktop kit.

Welcome provides new allocation, edit allocation and system settings.

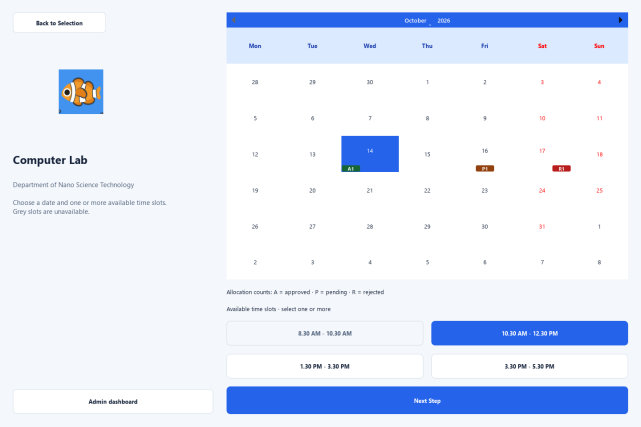

## Create an allocation

• Choose New allocation and select the required laboratory/workshop. Continue to the calendar.

• Choose today or a future date. Select one or more available slots. Disabled slots are already reserved or belong to a past date. Continue.

• Enter name, index, department, email, supervisor and project name. Description is optional. Confirm the allocation.

• Keep the displayed four-digit allocation key. The request begins Pending and waits for administrator review.

Calendar and slots. Pending and Approved requests reserve their slots; Rejected requests release them.

USER MANUAL / 2 OF 3

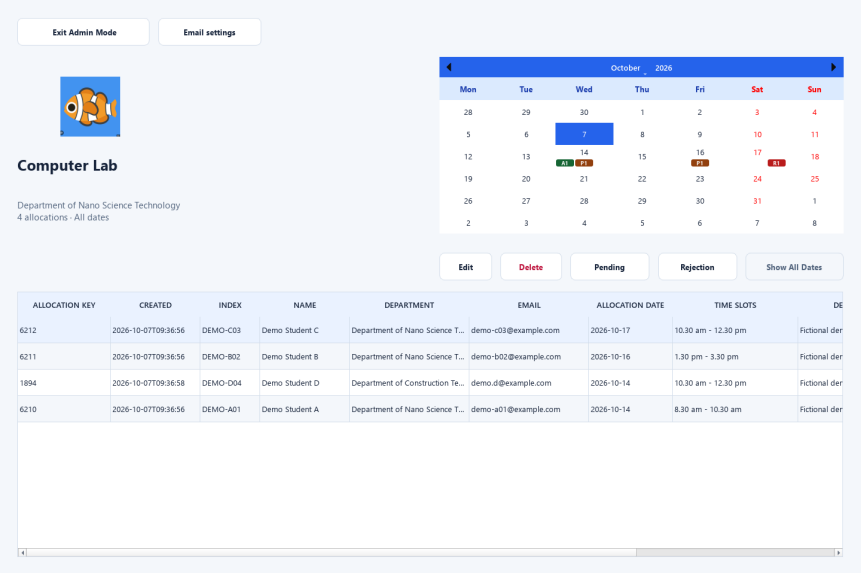

# Edit and administrator review

## Change or cancel your allocation

From Welcome choose Edit allocation and enter your saved key. If a legacy duplicate requires an index, enter your student index too. Review the saved details and change the laboratory, future date, available slots or form information. Update Allocation keeps the key and submits the request as Pending again. Delete Allocation requires confirmation. A past booking can be viewed/deleted, but an update needs a current/future schedule.

## Administrator access and review

Start a new allocation path, select a laboratory and open Admin dashboard from its calendar. Enter the laboratory passcode. The initial passcode is 0000 only when local settings have no saved replacement. Choose a date to filter or Show All Dates to reset. Select a row before using Edit, Delete or an email action.

Administrator dashboard. Scroll the table horizontally to see remarks and status columns.

Change the status dropdown to Pending, Approved or Rejected. Remarks save when the editor loses focus. Rejected frees slots; reapproving checks that they are still free. An administrator edit keeps its previous status.

## Pending and rejection email drafts

Configure the in-charge and department/head email addresses in administrator settings. Pending/Rejection opens a draft in your default email application after saving status. Review and send there. SYNCLAB does not send or confirm delivery. A missing email handler shows a warning; the saved status remains.

USER MANUAL / 3 OF 3

# Settings, backup and known constraints

## System settings

Open Settings from Welcome and enter the master passcode. The initial default is 0000 unless changed. Set workshop/master passcodes, toggle light/dark mode or choose a readable wallpaper image. Keep the wallpaper file available because its path is saved. Settings and notification addresses live in QSettings, separate from the database.

## Back up the data

• Close SYNCLAB completely before copying the database.

• For the supplied launcher, back up Windows_x64/data/student_data.db. Source builds first prefer their compiled SOURCE_DIR/data folder, then existing working/executable/local-app copies. Confirm which copy is selected.

• Copy the selected file to a dated backup folder. Keep configuration details and any external wallpaper separately.

## Restore a compatible backup

Close the application. Preserve the current database as a separate copy, then replace the selected student_data.db with a compatible saved copy. Reopen and verify record counts, dates, keys and status. Routine backup/restore is a manual file procedure. During a detected legacy migration the application also creates a .pre-4nf.bak copy.

## Known constraints

• Keep the runnable folder intact and use its launcher. For source builds, confirm the embedded source data path.

• The workshop list and four daily slot periods are fixed. The system does not model capacity or closures.

• Keys/passcodes are stored in plain local data/settings and provide limited access protection. Change initial administrator defaults.

• There is no active PDF upload, built-in report export, in-app recovery or remote synchronization.

• Changing a profile with the same student index affects its joined details across allocations.

For build failures, database initialization errors and SQL-driver checks see SYNCLAB_Group_01_Build_and_Setup_Guide.pdf. Keep real records separate from supplied fictional demonstration data.
